

Ilias Test:
Perception →

Question 1

Which statements are correct?

- a) In the outermost periphery, colour perception is best
- b) Cones are located predominantly in the central retina and are important for color vision ✓
- c) The highest visual resolution is located in the fovea ✓
- d) Rods are mainly responsible for colour perception
- e) The fovea is identical to the blind spot
- f) In the very central area, there are no blue colour receptors ✓

Question 2

Which statements are correct?

- a) Retinal disparity arises because the two eyes receive slightly different images ✓
- b) Stereopsis combines the different images from both eyes into a three-dimensional experience ✓
- c) Motion parallax is a primary depth cue
- d) Texture gradient is a primary depth cue
- e) Accommodation is a secondary depth cue
- f) Convergence is a colour model

Question 3

Which statements are correct?

- a) Additive colour mixing concerns light sources, for example displays ✓
- b) Subtractive colour mixing concerns printed colours on materials, where parts of the light are reflected or absorbed ✓
- c) According to the slides, subtractive colours are generally glossier than additive colours
- d) Additive colour information should never be embedded in a bright environment
- e) Additive colour mixing is typical for printing on paper
- f) Subtractive colour arises through differences in decibels

Question 4

Which statements are correct?

- a) Transduction translates sound vibrations into neural impulses ✓
- b) Auditory grouping includes segregation into streams and integration into coherent streams ✓
- c) Scene analysis and interpretation belong to the four stages of auditory perception ✓
- d) Auditory grouping is based exclusively on colour
- e) In auditory perception, the first two processes of auditory grouping cannot ignore sound
- f) MP3 is explained in the chapter as an example of visual compression

Question 5

Assign each statement to the corresponding text

- Foveal perception
 - Detail and sharpness perception are best in this area
- Peripheral perception
 - People react particularly sensitively to movement outside the main focus
- Tunnel effect
 - Stimuli outside the focus can be ignored despite the sensitivity to them
- Cognitive reconstruction
 - Missing information is supplemented based on experience and previous images

Question 6

Assign each interface design decision to the corresponding depth cue

- One window overlaps another window
 - Overlap
- An object with a shadow appears three-dimensional
 - Light and shade
- Similar objects are displayed in smaller sizes
 - Relative size
- The background pattern becomes denser towards the back
 - Texture gradient

Question 7

Match each statement to the corresponding modality advantage

- Can indicate where the eyes should look → Audio
- Information often remains visibly available → Vision
- Can be perceived faster than visual cues → Audio
- Can originate from outside the field of view → Audio

Question 8

A drop-down menu opens smoothly along a shared direction of movement

- a) Continuity and Common Fate ✓
- b) Subtractive colour and presbyopia
- c) Area principle and decibel
- d) Hue and chroma

Question 9

Match each of the two highlighted areas in the figure with the most appropriate Gestalt principle

1. Proximity
2. Similarity

Gestalt Laws

In the spirit of Gestalt we can define laws by combining the existing ones into new ones to create something other than the sum of the parts.
